## DETAILED ACTION

### ***Claim Rejections - 35 USC § 102***

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this

Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claim 1 is rejected under 35 U.S.C. 102(b) as being anticipated by Cecur (WO 00/20730).

Cecur discloses a valve timing mechanism, in particular for four-cycle engines, having the following components: a rocker arm frame which is configured in one piece from lightweight metal and has two bars which are connected by webs, for accommodating rocker arms (see figure 4); hydraulic elements for valve clearance compensation which have an outer piston which is open on one side and has a supporting ball which is configured in one piece at the closed end of said outer piston, and an inner piston which is open on one side, is guided in the outer piston and is connected in flow terms via a spring-loaded ball valve to a high-pressure space of said outer piston (see figure 2, numeral 4); a steel sheet part which is arranged between the hydraulic elements and the rocker arm frame (see adjacent numeral 41); a pressurized oil line which is arranged in the longitudinal extent of the rocker arm frame at the level of the

open end of the hydraulic elements (see figure 2); deep-drawn steel sheet rocker arms which are configured uniformly for all the valves (see numeral B), having a U-shaped cross section and having cylindrical rollers mounted on needle bearings for at least one camshaft (see numeral R), and having a cap for the supporting ball (see adjacent numeral 14), and having contact elements for the valve stems of the inlet and outlet valves (see numeral V), characterized in that the outer pistons of the hydraulic elements are guided in blind bores of the rocker arm frame, and in that a steel disk is arranged at the bottom of the blind bores as a stop for the inner piston (see numeral 4).

### ***Allowable Subject Matter***

3. Claims 2-10 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

### ***Conclusion***

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Sakata (4,840,151) discloses the hydraulic element that is similar to the claimed invention.
